

**IN THE SPECIFICATION**

Please amend the Specification, as follows:

Please amend Paragraph [0004], pages 1-2, as follows:

[0004]The purpose of this invention is to reduce the time required to remove and replace a welding gun actuator. This is accomplished by a quick change device which includes a mounting plate. The mounting plate has at least one and preferably two or more keyhole type apertures for fasteners which attach the mounting plate to the welding gun. The mounting plate can be released from the welding gun by ~~loosing~~ loosening the fasteners and shifting the mounting plate to align the heads of the fasteners with the wide portions of the keyhole type apertures. The wide portions of the apertures are large enough to clear the fastener heads so that the mounting plate can be separated from the welding gun without the necessity of removing the fasteners.
